

The effectiveness of data visualization can be gauged by its simplicity, relevancy, and its ability to hold the user's hand during their data discovery journey.

Chart mana yang Tepat?

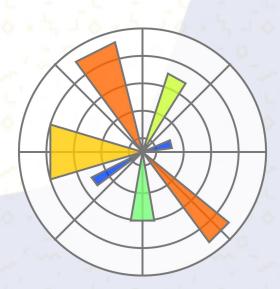

Matplotlib adalah Python 2D plotting library yang menghasilkan gambar berkualitas publikasi dalam berbagai format hardcopy dan environment interaktif di seluruh platform.

Import matplotlib

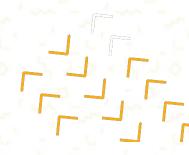

Pyplot adalah modul dari package matplotlib yang memungkinkan kita untuk membuat figures dan axes secara otomatis dan implisit

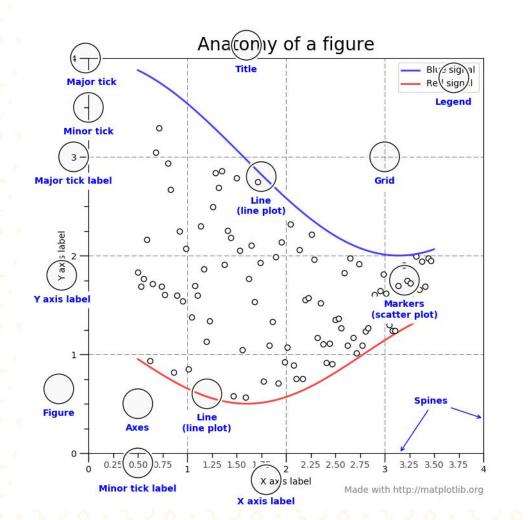

Import matplotlib.pyplot as plt

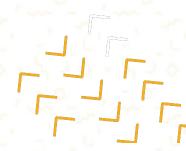

Anatomi Figure Matplotlib

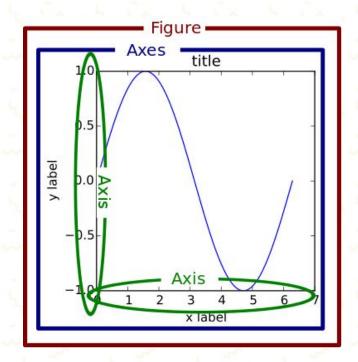

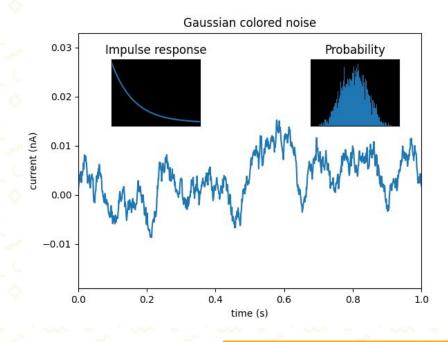

Axes adalah element dari Figure yang memuat: Axis, Tick, Line2D, Text, Polygon, etc., dan rangkaian koordinat sistem. Satu figure pada matplotlib dapat memiliki lebih dari 1 axes.

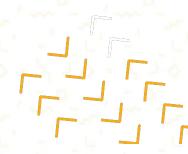

Subplot adalah axes yang dituangkan ke dalam grid system

plt.subplot(nrows, ncols, axes)

fig = plt.figure(figsize=(20,10))

ax1 = fig.add_subplot(121)

ax2 = fig.add_subplot(122)

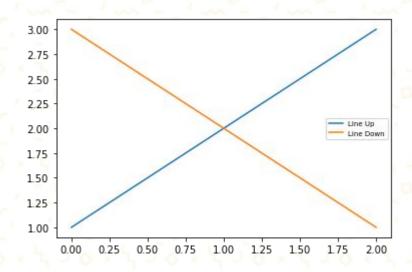

Fungsi legend untuk meletakkan legend pada axes

fig, ax = plt.subplots()

line_up, = ax.plot([1, 2, 3], label='Line 2')

line_down, = ax.plot([3, 2, 1], label='Line 1')

ax.legend([line_up, line_down], ['Line Up', 'Line Down'])

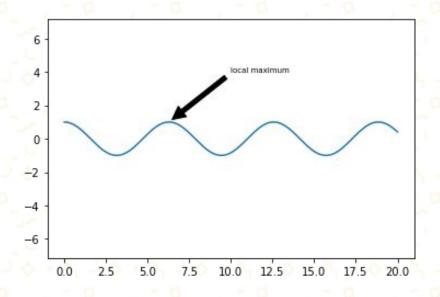

Fungsi annotation adalah untuk memberikan text, panah, atau object lainnya pada axes

ax.annotate('local maximum', xy=(6.28, 1), xytext=(10, 4),arrowprops=dict(facecolor='black', shrink=0.05))

plt.show()

Save Figures

plt.savefig('foo.png', transparent=True)

Close and Clear

Clear an axis

plt.cla()

Clear the entire figure

plt.clf()

Close a window

plt.close()

Template Visualisasi

Matplotlib

```
x = [1,2,3,4]
y = [10,20,25,30]
fig = plt.figure()
ax = fig.add_subplot(111)
ax.plot(x, y, color='lightblue', linewidth=3)
ax.scatter([2,4,6], [5,15,25], color='darkgreen', marker='^')
ax.set_xlim(1, 6.5)
plt.savefig()
plt.show()
```

Thank YOU
